

HACKTOBERFEST HACK DAY HYDERABAD

MLH × DEV × REACT HYDERABAD

ELAHLABS • 2-HOUR HACK DAY BUILD

BUILD ON ELAH

Build an AI-powered video editing experience on elah.

ELAHLABS • 2-HOUR HACK DAY BUILD

BUILD SMALL. MAKE IT WORK. MAKE IT YOURS.

THE PROBLEM

Video editing can be powerful, but manual editing takes time. Build a browser-based experience where AI helps turn a user's intent into structured video edits that can be previewed, accepted, rejected, or refined.

01 What you are building

- Use natural language as the starting point for an editing request.
- Represent the AI's plan as structured edits rather than allowing the model to manipulate the editor freely.
- Apply only valid operations to the video timeline.
- Let the user see what the AI is proposing before deciding what to keep.
- Make the complete AI action reversible in one step.

THE CORE LOOP

Example requests

- "Tighten the intro and remove the first 10 seconds."
- "Put my name as a lower third at the start."
- "Fade to the b-roll instead of cutting."
- "Move this clip earlier and add a subtitle."
- Create your own requests as long as they can be expressed using the allowed operations.

WHAT COULD YOU BUILD?

These are idea directions, not fixed requirements. Start here, combine them, or take the idea somewhere completely different.

02 Idea directions

DIRECTION 01

Brief → Reel

Turn a short brief and a folder of assets into a finished short video. Let the model create a structured build spec and correct it when validation fails.

DIRECTION 02

Highlight Cut

Take a longer talking-head recording and turn it into a shorter highlight cut with captions and an easy one-step undo.

DIRECTION 03

Conversational Editor

Let users say what they want changed — tighten a section, add a lower third, move a clip, add a transition — and turn that request into safe, structured operations.

GO FURTHER

Your Own Idea

Build another AI-powered editing workflow on elah. The examples above are starting points, not limits.

IMPORTANT

- Your model should work with structured editing data rather than directly manipulating pixels or the DOM.
- Keep the scope focused enough to finish a working experience in two hours.
- Make the AI contribution visible in your demo.
- A smaller working workflow is better than a large unfinished editor.

THE 120-MINUTE PLAN

Pick the smallest version of your idea that proves the AI-powered editing workflow actually works.

03 Build plan

TIME	MILESTONE	OUTPUT
00–15	Choose your idea	One editing workflow + one user story.
15–30	Get elah running	Editor/project loaded + first edit working.
30–70	Build the AI loop	User request → structured edit plan.
70–105	Make it useful	Validation, preview, undo, refinement.
105–120	Polish + demo	Working flow + 2-minute demo.

DEMO CHECK

- Show the user request and the AI-generated edit plan.
- Show the resulting change in the video editor.
- Demonstrate that the AI edit can be undone or discarded.
- Try an invalid or unsupported request and handle it cleanly.
- Explain in one sentence what makes your AI editing experience useful.

BUILD SMALL. MAKE IT WORK. MAKE IT YOURS.
