

HACKTOBERFEST HACK DAY HYDERABAD

MLH × DEV × REACT HYDERABAD

OFFICIAL MLH CHALLENGE • 2-HOUR HACK DAY BUILD

BEST OPEN-SOURCE AI PROJECT

Build an original project where open-source or open-weight AI is
an important part of how the product works.

OFFICIAL MLH CHALLENGE • 2-HOUR HACK DAY BUILD

BUILD SMALL. MAKE IT WORK. MAKE IT INTERESTING.

THE PROBLEM

Open AI models and tooling are powerful, but useful developer and community workflows still need to be built. Create a small, real project that puts open-source or open-weight AI at the center of the experience.

01 What counts

- Open-source or open-weight AI must be an important part of the project, not a decorative add-on.
- You may build with an open-weight language model, create an agent skill, or build/adapt an open-source model harness.
- Your project must be published in a public GitHub repository.
- The repository must use an open-source license.
- If you build an agent skill, it must comply with the Agent Skill Open Standard.
- If you submit a model-harness project, it must include an original implementation or meaningful changes to an existing open-source harness.

A GOOD MENTAL MODEL

OPEN MODEL / OPEN TOOL

MEANINGFUL PRODUCT LOGIC

USEFUL OUTCOME

A developer, creator, learner, or
community member can use it.

WHAT COULD YOU BUILD?

These are idea igniters. They are not fixed problem statements. Teams are encouraged to bring a different idea as long as it satisfies the official challenge requirements.

02

Idea directions

AI DEVELOPER SIDEKICK

Explain an unfamiliar repository, generate tests, diagnose a bug, summarize an issue, or turn a stack trace into a useful debugging path.

MAKE OPEN SOURCE EASIER

Help contributors discover issues, understand project conventions, prepare a contribution, or navigate documentation.

BUILD AN AGENT SKILL

Create a focused reusable skill that gives an agent a concrete capability following the Agent Skill Open Standard.

MODEL-POWERED TOOL

Build a small application where an open-weight model is central to the workflow — not merely used to generate code.

IMPORTANT

- Using an AI coding assistant to write your project does not by itself make the project an Open-Source AI Project.
- The AI component should be visible in the product architecture and demo.
- Keep the scope narrow: one useful workflow is enough.
- A small project with a clear open-source AI contribution is easier to demonstrate than a large unfinished platform.

THE 120-MINUTE PLAN

Pick the smallest version of your idea that proves the open-source AI component actually works.

03 Build plan

TIME	MILESTONE	OUTPUT
00–15	Choose the path	Model / agent skill / harness + one user story.
15–30	Bootstrap	Repo, license, model/tool wired, sample input.
30–80	Build core	End-to-end AI workflow working once.
80–105	Make it useful	Better prompt/schema, validation, UI, errors.
105–120	Ship + demo	Public repo, license, README, 2-minute demo.

JUDGE / DEMO CHECK

- Show the public GitHub repository and open-source license.
- Point to the open-source/open-weight AI component and explain why it is important.
- Run the core workflow live rather than only showing screenshots.
- If it is an agent skill, show the skill being invoked and the useful result.
- If it is a model harness, show what your original implementation or meaningful modification adds.

BUILD OPEN. BUILD USEFUL. MAKE THE AI COMPONENT MATTER.
